

January 9, 2026

Dear [Senator/Representative]:

The undersigned organizations, representing health care clinicians, public health professionals, scientists, patients, and family advocates, **urge you to conduct swift and robust oversight regarding the abrupt changes to the U.S. childhood vaccine schedule announced on Jan. 5, 2026**. It is essential that action is promptly taken to protect vaccine availability and coverage for all previously recommended immunizations for all families, including through the Vaccines for Children program.

This week's overhaul of the childhood vaccine schedule was not based on credible evidence. The Department of Health and Human Services (HHS) announced that the U.S. would now follow a vaccine schedule that appears to be modeled after guidance used in Denmark. However, the prior U.S. recommendations have been effective in keeping children healthy: studies estimate that from 1994 to 2023, routine childhood vaccinations have prevented approximately 508 million cases of illness, 32 million hospitalizations, and over 1 million deaths in the United States.¹ In addition, vaccine recommendations are largely based on a population's risk of exposure to a disease and how that disease impacts health.

HHS's decision to dismantle a credible childhood vaccine schedule will create even greater confusion for families and health care professionals, and leave more people unprotected against serious vaccine-preventable diseases. These changes lack a clear scientific basis and were made without following the standard process, which ensures transparency and input from the public and key stakeholders. Usually, a multidisciplinary team of experts, part of the CDC's Advisory Committee on Immunization Practices (ACIP), reviews new data about vaccines and disease trends and makes recommendations to federal officials. Last year, the HHS Secretary fired every member of this committee and appointed numerous people who have expressed doubts about the benefits of vaccines in their place. And yet even this newly constituted committee was not afforded the opportunity to publicly discuss this schedule before it was announced.

We urge you to investigate why the schedule was changed, why credible scientific evidence was ignored, and why the committee charged with advising the HHS Secretary on immunizations did not discuss the schedule changes as a part of their public meeting process.

Under HHS's new schedule, numerous vaccines proven to reduce hospitalizations, serious illness and chronic health issues are no longer routinely recommended for children.

¹ <https://www.cdc.gov/mmwr/volumes/73/wr/mm7331a2.htm>

Specifically, rotavirus, COVID-19, influenza, meningococcal disease, hepatitis A, and hepatitis B are all downgraded to an unsupported “shared clinical decision making” (SCDM) designation. Immunizations for respiratory syncytial virus (RSV), hepatitis A, hepatitis B, and meningococcal disease are now included in a new category, “Immunizations recommended for Certain High-Risk Groups or Populations.” **And while communities across the country endure increasing hospitalizations and deaths from seasonal flu, including the deaths of nine children in the last few months, federal health officials are now no longer recommending the flu vaccine for children.**

Further, insurance coverage for this new three-tiered recommended schedule is not guaranteed under existing statutory and payer frameworks, particularly for those vaccines now falling under an SCDM designation. Downgrading from designating vaccines as recommended for a population to instead saying they are left to SCDM may undermine liability protections under the Vaccine Injury Compensation Program (VICP), and calls into question whether those vaccines are still covered by the program.

The confusion and chaos caused by these changes may make parents doubt the benefits of vaccines and delay or skip these vaccines for their children, with devastating and foreseeable impacts, including:

- Increased hospitalizations and deaths due to influenza, including pediatric deaths, like those recently reported in Illinois and Massachusetts, when the U.S. is already facing more influenza cases and lower influenza vaccine rates compared to this time last year.
- Reversal of progress on rotavirus, for which routine vaccination, in just the first five years after it was introduced (2007-2011), averted an average annual 280,000 clinic visits, 62,000 emergency department visits, and 45,000 hospitalizations for commercially insured U.S. children under 5.²
- Negative impacts to community immunity levels for babies too young to be vaccinated and the millions of Americans with weakened immune systems (such as people with cancer and organ transplants) and other risk factors who rely on high rates of vaccination for protection.

Any changes to the recommended immunization schedule, particularly changes of such great magnitude, should be made through a transparent public process through which the scientific data underpinning any potential changes is made public and carefully reviewed by experts. Critically, vaccine recommendations must be based upon the best available scientific data. The recent changes announced to the U.S. immunization schedule do not

² <https://www.cdc.gov/pinkbook/hcp/table-of-contents/chapter-19-rotavirus.html#:~:text=The%20marked%20reduction%20in%20rotavirus%20disease%20burden%20in%20the%20United,age%20for%20the%20final%20dose>

meet these standards, greatly failing any test for “gold-standard science,” which is critical to protect public health and earn public trust.

We urge you to conduct swift and robust oversight regarding the abrupt changes to the U.S. childhood vaccine schedule and its ramifications to our nation’s vaccine infrastructure and children’s health. Our organizations stand ready to help your efforts. We appreciate your attention to this issue, and we look forward to working with you to protect your constituents’ access to life-saving vaccines.

Sincerely,

National Organizations
